IN THE UNITED STATES PATENT AND TRADEMARK OFFICE
REQUEST FOR FILING NATIONAL PHASE OF
PCT APPLICATION UNDER 35 U.S.C. 371 AND 37 CFR 1.494 OR 1.495

To: Hon. Commissioner of Patents
Washington, D.C. 20231

TRANSMITTAL LETTER TO THE UNITED STATES
DESIGNATED/ELECTED OFFICE (DO/EO/US)

Atty Dkt: P 277034 /H7353US
M# /Client Ref.

From: Pillsbury Winthrop LLP, IP Group:

Date: February 5, 2002

This is a **REQUEST** for FILING a PCT/USA National Phase Application based on:

1. International Application <u>PCT/JP00/05199</u> ↑ country code	2. International Filing Date <u>03 August 2000</u> Day MONTH Year	3. Earliest Priority Date Claimed <u>05 August 1999</u> Day MONTH Year (use item 2 if no earlier priority)
---	---	---

4. Measured from the earliest priority date in item 3, this PCT/USA National Phase Application Request is being filed within:

(a) 20 months from above item 3 date (b) 30 months from above item 3 date,
(c) Therefore, the due date (unextendable) is February 5, 2002

5. Title of Invention **MUSIC REPRODUCING APPARATUS, MUSIC REPRODUCING METHOD AND TELEPHONE TERMINAL DEVICE**

6. Inventor(s) Nobukazu NAKAMURA

Applicant herewith submits the following under 35 U.S.C. 371 to effect filing:

7. Please immediately start national examination procedures (35 U.S.C. 371 (f)).

8. A copy of the International Application as filed (35 U.S.C. 371(c)(2)) is transmitted herewith (file if in English but, if in foreign language, file only if not transmitted to PTO by the International Bureau) including:

- Request;
- Abstract;
- ____ pgs. Spec. and Claims;
- ____ sheet(s) Drawing which are informal formal of size A4 11"

9. A copy of the International Application has been transmitted by the International Bureau.

10. A translation of the International Application into English (35 U.S.C. 371(c)(2))

- is transmitted herewith including: (1) Request; (2) Abstract;
(3) _____ pgs. Spec. and Claims;
(4) _____ sheet(s) Drawing which are:
 informal formal of size A4 11"
- is not required, as the application was filed in English.
- is not herewith, but will be filed when required by the forthcoming PTO Missing Requirements Notice per Rule 494(c) if box 4(a) is X'd or Rule 495(c) if box 4(b) is X'd.
- Translation verification attached (not required now).

11. PLEASE SEE THE ATTACHED PRELIMINARY AMENDMENT

RE: USA National Filing of PCT /JP00/05199

12. Amendments to the claims of the International Application under PCT Article 19 (35 U.S.C. 371(c)(3)), i.e., before 18th month from first priority date above in item 3, are transmitted herewith (file only if in English) including:

13. PCT Article 19 claim amendments (if any) have been transmitted by the International Bureau

14. Translation of the amendments to the claims under PCT Article 19 (35 U.S.C. 371(c)(3)), i.e., of claim amendments made before 18th month, is attached (required by 20th month from the date in item 3 if box 4(a) above is X'd, or 30th month if box 4(b) is X'd, or else amendments will be considered canceled).

15. **A declaration of the inventor** (35 U.S.C. 371(c)(4))
 a. is submitted herewith Original Facsimile/Copy
 b. is not herewith, but will be filed when required by the forthcoming PTO Missing Requirements Notice per Rule 494(c) if box 4(a) is X'd or Rule 495(c) if box 4(b) is X'd.

16. **An International Search Report (ISR):**
 a. Was prepared by European Patent Office Japanese Patent Office Other
 b. has been transmitted by the international Bureau to PTO.
 c. copy herewith (pg(s.)) plus Annex of family members (pg(s.)).

17. **International Preliminary Examination Report (IPER):**
 a. has been transmitted (if this letter is filed after 28 months from date in item 3) in English by the International Bureau with Annexes (if any) in original language.
 b. copy herewith in English.
 c. 1 IPER Annex(es) in original language ("Annexes" are amendments made to claims/spec/drawings during Examination) including attached amended:
 c. 2 Specification/claim pages # claims #
 Dwg Sheets #
 d. Translation of Annex(es) to IPER (required by 30th month due date, or else annexed amendments will be considered canceled).

18. **Information Disclosure Statement** including:
 a. Attached Form PTO-1449 listing documents
 b. Attached copies of documents listed on Form PTO-1449
 c. A concise explanation of relevance of ISR references is given in the ISR.

19. **Assignment** document and Cover Sheet for recording are attached. Please mail the recorded assignment document back to the person whose signature, name and address appear at the end of this letter.

20. Copy of Power to IA agent.

21. **Drawings** (complete only if 8d or 10a(4) not completed): 10 sheet(s) per set: 1 set informal; Formal of size A4 11"

22. Small Entity Status is Not claimed is claimed (pre-filing confirmation required)

22(a) (No.) Small Entity Statement(s) enclosed (since 9/8/00 Small Entity Statements(s) not essential to make claim)

23. **Priority** is hereby claimed under 35 U.S.C. 119/365 based on the priority claim and the certified copy, both filed in the International Application during the international stage based on the filing in (country) of:

Application No.	Filing Date	Application No.	Filing Date
(1) 11/222319	5 August 1999	(2) 11/222320	5 August 1999
(3) 11/309408	29 October 1999	(4) <u> </u>	<u> </u>
(5) <u> </u>	<u> </u>	(6) <u> </u>	<u> </u>

a. See Form PCT/IB/304 sent to US/DO with copy of priority documents. If copy has not been received, please proceed promptly to obtain same from the IB.
 b. Copy of Form PCT/IB/304 attached.

24. Attached:

DESCRIPTION
TITLE OF THE INVENTION

10/049351

MUSIC REPRODUCING APPARATUS, MUSIC REPRODUCING METHOD AND
TELEPHONE TERMINAL DEVICE

5

SPECIFICATION

BACKGROUND OF THE INVENTION

Field of the Invention

The present invention relates to a music reproducing apparatus and a music reproducing method suitable for use in 10 a car telephone or portable telephone.

Related Art

In portable telephone systems such as PDC (Personal Digital Cellular Telecommunication System) known as analog or digital cellular systems, or PHS (Personal Handy-Phone Systems), a telephone terminal device rings to alert a user 15 at the time of arrival of a call. Conventionally, the alert was made by beeping sound, but it has recently replaced by a melody because the beeping sound is a kind of noise offensive to the ear.

20 The above-mentioned type of conventional telephone terminal device can generate a melody, but the melody is far from satisfactory quality.

To solve this problem, the use of a music piece 25 reproducing apparatus with an automatic performance function has been considered effective. Such a conventional music piece reproducing apparatus capable of automatic performance includes a central processing unit (CPU), a read only memory

(ROM), a random access memory (RAM) and a tone generator. It reproduces a piece of music as follows: The CPU executes an automatic performance program stored in the ROM to read music data from the ROM or RAM while setting tone generation parameters on the tone generator.

Such a telephone terminal device is required to be compact, low priced and multi-functional. The built-in CPU must execute various kinds of operations such as to process incoming and outgoing calls and make a display. In other words, if the music piece reproducing apparatus is used in a portable type of the telephone terminal device, the CPU must carry out reproduction of a music piece in addition to other telephony functions, and this requires a high-speed CPU. The higher the processing speed of the CPU, the more the telephone terminal device costs.

The use of a melody IC with a melody reproducing function is also known. The melody IC is constituted of a tone generator, a sequencer, a ROM for storing musical score data, and another ROM for storing timbre data. Upon receipt of a music reproduction instruction from the outside, the melody IC reproduces melody tones along musical score data read from the musical score data ROM with timbres read from the timbre data ROM. If such a melody IC is incorporated into a telephone terminal device, the CPU is not required to perform reproduction of a music piece, and this makes it possible to use an inexpensive, low-speed CPU.

The melody IC, however, has a small storage capacity for the timbre data ROM. The storage capacity of the timbre data

ROM is so small that the number of parameters and kinds of timbre data are limited, and this makes it difficult to generate tones of high quality or a variety of tones.

Further, the melody IC has a small storage capacity for 5 the musical score data ROM such that the number of storable music pieces and the length of a music piece to be reproduced are limited. The storage capacity of the musical score data ROM is so small that a large amount of music data needed for reproducing a music piece of high quality cannot be stored, 10 thereby prohibiting all but some melodies of low quality from being reproduced.

OBJECTS AND SUMMARY OF THE INVENTION

In consideration of these circumstances, it is an object 15 of the present invention to provide a music piece reproducing apparatus and a music piece reproducing method that enable music pieces to be reproduced with a variety of timbres even though a memory for storing timbre data has a small storage capacity.

20 It is another object of the present invention to provide a music piece reproducing apparatus and a music piece reproducing method that enable music pieces to be reproduced with a variety of timbres even though a memory for storing music score data has a small storage capacity.

25 It is a further object of the present invention to provide a music piece reproducing apparatus, a music piece reproducing method, and a telephone terminal device, by which music pieces with tones of high quality can be reproduced

even with a low-speed processing unit.

In order to achieve the above noted objects, an inventive music reproducing apparatus comprises a timbre data memory that has a limited capacity for storing timbre data corresponding to a first number of timbres, which is less than a second number of timbres reserved in a data source, an interface that can be operated to transfer the timbre data from the data source to the timbre data memory so that the timbre data memory stores the transferred timbre data, a score data memory that stores score data representing a music piece, a tone generator that is set with a tone generating parameter derived from the score data stored in the score data memory for generating tones of the music piece, and a performance controller that interprets the score data to read out timbre data designated by the score data from the timbre data memory for setting the tone generator with the read timbre data so that the tone generator can generate the tones having timbres specified by the score data.

Preferably, the tone generator can concurrently generate a third number of tones allotted to respective parts of the music piece, which are not more than the second number of timbres available by the timbre data memory, and the performance controller reads out timbre data corresponding to the third member of timbres which are assigned to the respective parts according to the score data.

An inventive electronic apparatus comprises a processor

that processes data to execute a task, a memory device that memorizes data including music data comprised of timbre data and score data to represent music pieces, and a music reproduction device that operates according to the music data under control by the processor to reproduce a music piece in association with the task executed by the processor, wherein the music reproduction device comprises a timbre data memory that has a limited capacity for storing timbre data corresponding to a first number of timbres, which is less than a second number of timbres reserved in the memory device, an interface that can be operated to transfer the timbre data from the memory device to the timbre data memory so that the timbre data memory stores the transferred timbre data, a score data memory that stores score data representing a music piece, a tone generator that is set with a tone generating parameter derived from the score data stored in the score data memory for generating tones of the music piece, and a performance controller that interprets the score data to read out timbre data designated by the score data from the timbre data memory for setting the tone generator with the read timbre data so that the tone generator can generate the tones having timbres specified by the score data.

Preferably, the tone generator can concurrently generate a third number of tones allotted to respective parts of the music piece, which are not more than the second number of timbres available by the timbre data memory, and the

performance controller reads out timbre data corresponding to the third member of timbres which are assigned to the respective parts according to the score data.

Preferably, the inventive electronic apparatus further 5 comprises a communication device that can communicate with an external database to download therefrom music data into the memory device.

An inventive telephony terminal apparatus comprises a communication unit that transmits a signal to a remote 10 location and receives a signal from the remote location, and a music reproduction unit that can reproduce a music piece in association with the signal, wherein the music reproduction unit comprises a score data memory that memorizes score data representing a music piece, a tone generator of a frequency 15 modulation type settable with parameters for generating harmonics by frequency modulation to synthesize a tone, and a performance controller that sets the tone generator with parameters according to the memorized score data for enabling the tone generator to synthesize tones of the music piece 20 represented by the score data.

Preferably, the music reproduction unit further comprises a timbre data memory that has a limited capacity for memorizing timbre data corresponding to a predetermined number of timbres, and the performance controller interprets 25 the score data to read out timbre data corresponding to a timbre designated by the score data from the timbre data

memory, and sets the tone generator according to the read timbre data to thereby enable the tone generator to synthesize the tones of the music piece having the timbre designated by the score data.

5 Preferably, the music reproduction unit further comprises an interface that can transfer data including the timbre data between the music reproduction unit and other units, the interface being operated for transferring the timbre data to the music reproduction unit so as to load the 10 timbre data memory.

Preferably, the inventive telephony terminal apparatus further comprises a central processing unit that treats various data and a memory unit that reserves various data including music data composed of score data and timbre data, 15 wherein the interface is operated under control by the central processing unit for transferring the timbre data from the memory unit to the timbre data memory of the music reproduction unit and for transferring the score data from the memory unit to the score data memory of the music 20 reproduction unit.

Preferably, the memory unit reserves timbre data corresponding to a first number of timbres, wherein the timbre data memory of the music reproduction unit memorizes timbre data being transferred from the memory unit and 25 corresponding to a second number of timbres which are less than the first number of timbres, wherein the tone generator

can concurrently generate a third number of tones allotted to respective parts of the music piece, which are not more than the second number of timbres available by the timbre data memory, and wherein the performance controller reads out 5 timbre data from the timbre data memory corresponding to the third member of timbres which are assigned to the respective parts according to the score data.

Preferably, the communication unit can receive a signal representing either of the score data and the timbre data so 10 as to download the same into the memory unit.

An inventive music reproducing apparatus comprises a score data memory that has a limited space for storing a part of score data, which represents a music piece and which can be provided from a data source, an interface that can be 15 operated to load the score data from the data source into the score data memory, a tone generator that is set with a variable parameter derived from the score data for sequentially generating tones of the music piece, a performance controller that sequentially retrieves the score 20 data from the score data memory so as to set the tone generator with the variable parameter according to the retrieved score data, and a memory monitor that detects when a vacant area is created in the limited space of the score data memory upon sequential retrieval of the score data for 25 operating the interface to load another part of the score data into the vacant area, thereby enabling the tone

generator to continue the generating of the tones of the music piece.

Preferably, the inventive music reproducing apparatus further comprises a timbre data memory that stores timbre data corresponding to a number of timbres, wherein the performance controller reads out timbre data corresponding to a timbre designated by the score data from the timbre data memory, and sets the tone generator with the read timbre data, thereby enabling the tone generator to generate the tones of the music piece having the designated timbre.

An inventive electronic apparatus comprises a processor that processes data to execute a task, a memory device that memorizes data including score data representative of a music piece, and a music reproduction device that operates according to the score data under control by the processor to reproduce a music piece in association with the task, wherein the music reproduction device comprises a score data memory that has a limited space for storing a part of score data, which represents a music piece and which can be provided from the memory device, an interface that can be operated to load the score data from the memory device into the score data memory, a tone generator that is set with variable parameter derived from the score data for sequentially generating tones of the music piece, a performance controller that sequentially retrieves the score data from the score data memory so as to set the tone generator with the variable

parameter according to the retrieved score data, and a memory monitor that notifies the processor when a vacant area is created in the limited space of the score data memory upon sequential retrieval of the score data, so that the processor 5 operates the interface to load another part of the score data from the memory device into the vacant area of the limited space of the score data memory, thereby enabling the tone generator to continue the generating of the tones of the music piece.

10 Preferably, the inventive electronic apparatus further comprises a timbre data memory that stores timbre data corresponding to a number of timbres, wherein the performance controller reads out timbre data corresponding to a timbre designated by the score data from the timbre data memory, and 15 sets the tone generator with the read timbre data, thereby enabling the tone generator to generate the tones of the music piece having the designated timbre.

20 Preferably, the inventive electronic apparatus further comprises a communication device that can communicate with an external database to download therefrom score data into the memory device.

According to one aspect of the present invention, timbre data transferred through the interface are stored into the timbre data storage means, the storage capacity of which is 25 available only for required kinds of timbre data, so that the data amount for parameters in the timbre data can be large

enough to obtain tones of high quality even if the timbre data storage means has a small storage capacity, thereby reproducing a piece of music with tones of high quality.

Further, among the many kinds of timbre data stored in the storage means provided outside the music piece 5 reproducing apparatus, only the timbre data necessary to reproduce a piece of music are transferred to the music piece reproducing apparatus and stored in the timbre data storage means, so that several kinds of timbre data can be selected 10 for tones with which the piece of music is to be reproduced even though the storage capacity of the timbre data storage means is small. In addition, if the timbre data are downloaded to an external storage means through a 15 communication line, a choice of timbre data can be widened.

15 All the data processing means has to do is to read desired timbre data and to send the same to the music piece reproducing apparatus; it is not required to carry out reproduction of a piece of music. This allows music of high 20 quality to be reproduced even with a low-speed processing unit.

In addition, if the tone generator of the music piece reproducing apparatus provided in a telephone terminal device 25 is adopting a frequency modulating method, the amount of timbre data required for the frequency modulation type of the tone generator can be extremely reduced compared to that of a waveform memory type of the tone generator (PCM tone generator). Therefore, even if the timbre data is transmitted through a low-speed transmission path, for

example, due to low speed of data processing by the data processing means, the telephone terminal device can reproduce a piece of music with a variety of tones of high quality.

Further, since the amount of timbre data is reduced, timbre

5 data enough to reproduce a piece of music with tones of high quality can be stored even in a timbre data storage means, the storage capacity of which is smaller.

According to another aspect of the present invention, when a vacant area is created in the musical score storing 10 memory, a next portion of the musical score data is subsequently loaded into the memory. By such a construction, a music piece of a high quality requiring a great data volume can be reproduced even though the music score storing memory has a small capacity.

15 Further, the CPU is not required to execute the music reproduction process, but simply executes a data transfer process of feeding a next portion of the music score data when a vacant area is yielded in the memory buffering the music score data. Therefore, the CPU of moderate speed may 20 be sufficient to reproduce the high quality of the melody tones.

BRIEF DESCRIPTION OF THE DRAWINGS

By way of example and to make the description more clear, 25 reference is made to the accompanying drawings, in which:

Fig. 1 is a diagram showing the concept of how to download music data to portable telephones when a music piece reproducing apparatus of the present invention that embodies

a music piece reproducing method of the present invention is applied to the portable telephones;

Fig. 2 is a diagram showing an embodiment of a music piece reproducing apparatus of the present invention that 5 embodies a music piece reproducing method of the present invention when the music piece reproducing apparatus is applied to a portable telephone;

DETAILED DESCRIPTION OF THE INVENTION

Fig. 1 is a diagram showing the concept of how to download music data to portable telephones as telephone terminal devices when a music piece reproducing apparatus of the present invention that embodies a music piece reproducing

method of the present invention is applied to the portable telephones.

Systems for portable telephones are typically adopting cellular or cell splitting methods that install many radio-zones called cells in a service area. Each radio-zone is managed by one of cell sites or base stations A (2a) through D (2d). When users make calls from portable telephones 1 and 101 as mobile stations to ordinary telephones, the calls are first connected to a mobile telephone exchange station through a base station that manages the radio-zone to which the portable telephones now belong, then from the mobile telephone exchange station to a general telephone network. The portable telephones 1, 101 are connected through radio channels to the base station responsible for the radio-zone so that they can make calls to other telephones.

Fig. 1 shows an example of this type of cellular system. Shown in Fig. 1 is a case where the portable telephones 1, 101 are located within a radio-zone managed by a base station C(2c) in the base stations A(2a) through D(2d). The portable telephones 1, 101 are connected to the base station 2c through radio channels so that the base station 2c will receive and process upward signals when the telephones make calls or perform location registration. Although the base stations 2a through 2d are responsible for different radio-zones, the outer edges of the base stations may overlap each other. The base stations 2a through 2d are connected to a mobile exchange station 3 through a multiplexing network, and plural mobile exchange stations are consolidated by a gate

exchange station 4, then connected to a general telephone exchange station 5a. Plural gate exchange stations 4 provided in this system are connected to each other through a relay transmission line. ^G general telephone exchange stations 5 5 a, 5b, 5c, are located at each local area with a relay transmission line connecting them. Each of the general telephone exchange stations 5a, 5b, 5c, establishes connection with ordinary telephones. Then, in this case, a download center 6 is connected to the general telephone 10 exchange station 5b.

At the download center 6, new pieces of music are collected at any time and a large number of music data are stored. According to the present invention, music data can be downloaded to the portable telephones 1, 101 from the 15 download center 6 that is connected to the general telephone network. When the portable telephone 1 downloads music data, the user carrying the portable telephone 1 dials a telephone number of the download center 6, so that the portable telephone 1 is connected to the download center 6 in a path 20 from the portable telephone 1 to the download center 6 through the base station 20, the mobile exchange station 3, the gate exchange station 4, the general telephone exchange station 5a and the general telephone exchange station 5b. Then, the user operates dial buttons and the like on the portable 25 telephone 1 according to the menu indicated on its display to download music data associated to a desired music title. In this case, the music data is composed of musical score data and timbre data. Using the above-mentioned method, only the

timbre data indicative of a variety of tones or the musical score data may be downloaded to the portable telephone 1 individually.

Fig. 2 illustrates an embodiment of a music piece 5 reproducing apparatus of the present invention that embodies a music piece reproducing method of the present invention when the music piece reproducing apparatus is applied to a portable telephone as a telephone terminal device.

In Fig. 2, the portable telephone 1 includes an antenna 10 la that is generally retractable. The antenna 1a is connected to a communication unit 13 having modulation and demodulation functions. A central processing unit (CPU) 10 of the system is a system control part that executes telephone function programs to control the operation of each 15 part in the portable telephone 1. The system CPU 10 has a timer that measures an elapsed time in operation and generates a timer interrupt at certain intervals. Upon receipt of an interrupt request signal, the system CPU 10 executes auxiliary operations to support music piece 20 reproduction processing to be described later. A system RAM 11 is a RAM (Random Access Memory) that provides a storage area for music data composed of musical score data and timbre data downloaded from the download center 6, a user setting data storage area, a work area for the system CPU 10, and so 25 on. A system ROM 12 is a ROM (Read Only Memory) that stores several kinds of telephone function programs, such as to handle outgoing and incoming calls, executed by the system CPU 10, other programs for execution of auxiliary operations

to the music piece reproduction processing, and several kinds of preset data such as musical score data and timbre data.

The communication unit 13 serves to demodulate a signal received at the antenna 1a, and to modulate and supply a sending signal to the antenna 1a. The received signal demodulated at the communication unit 13 is decoded at a voice data processing unit (coder/decoder) 14. A receiver signal inputted from a microphone 21 is compressed and encoded at the voice data processing unit 14. The voice data processing unit 14 carries out highly efficient compressive coding/decoding of transmitting voice; it may be coder/decoder of a CELP (Code Excited LPC) or ADPCM (Adaptive Differential PCM Coding) type. A music piece reproducing unit 15 generates sound of the receiver signal from the voice data processing unit 14 and issues the same from a receiver speaker 22, or reproduces and outputs music data as a calling or holding tone. The calling tone is issued from a speaker 23 for incoming calls. The holding tone is mixed with the receiver signal and issued from the receiver speaker 22.

Suppose that the music piece reproducing unit 15 is reproducing music data. If there occurs a certain amount of available space in an inner storage means for the musical score data, the music piece reproducing unit 15 gives the system CPU 10 an interrupt request signal (IRQ). Upon receipt of the interrupt request signal (IRQ), the system CPU 10 reads a next continued part of music score data from the system RAM 11 or the system ROM 12, and transfers the read data to the music piece reproducing unit 15. An interface

(I/F) 16 is an interface through which music data composed of musical score data and timbre data are downloaded from external equipment 20 such as a personal computer. An input unit 17 is an input means with dial buttons from '0' to '9' and several other buttons provided on the portable telephone 1. A display unit 18 is a monitor display that shows a menu of telephone functions and other information changed according to button operations such as to operate dial buttons. A vibrator 19 is to inform the user of arrival of a call by silent vibration instead of calling sound. Each functional block sends and receives data and instructions through a bus 24.

Fig. 3 illustrates an exemplary configuration of the music piece reproducing unit 15 shown in Fig. 2.

In Fig. 3, an interface 30 is to receive several kinds of data through the bus 24. The interface 30 separates received data containing musical score data and timbre data from index data (INDEX) indicative of what data is received. The interface 30 outputs the data part from a data output and index data from an index output. An FIFO (First-In First-Out) buffer 31 is a storage means capable of storing a certain amount of musical score data, for example, up to 32 words. The musical score data is read out of the FIFO 31 sequentially from the earliest written part, and when there occurs a certain amount of available area in the FIFO 31, the FIFO 31 sends the system CPU 10 the interrupt request signal (IRQ).

An index decoder 32 decodes the index data, and supplies

the FIFO 31 with a write pulse (WP) and a latch pulse (LP) for IRQ point data to be described later. The index decoder 32 also supplies a sequencer 33 with index data AD1 to inform the sequencer 33 that the data directed to the sequencer 33 has been outputted from the data output of the interface 30. Further, the index decoder 32 supplies a timbre data storage unit (Voice RAM) 34 with index data AD2 to inform the timbre data storage unit (Voice RAM) 34 that the timbre data directed to the timbre data storage unit (Voice RAM) 34 has been outputted from the data output of the interface 30. The sequencer 33 applies a read pulse to the FIFO 31 to read the musical score data sequentially from the FIFO 31 while setting a tone generation parameter s on a tone generator 35 along the musical score data in synchronism with time information of the musical score data. The sequencer 33 also supplies the timbre data storage unit (Voice RAM) 34 with a timbre number for each part specified by timbre allocation data fetched from the data output of the interface 30 so that timbre parameters corresponding to the timbre number are read out of the timbre data storage unit (Voice RAM) 34 and set for each part on the tone generator 35.

The timbre data storage unit (Voice RAM) 34 is a storage means that stores timbre data fetched from the data output of the interface 30; it has such a small storage capacity, for example, that it can store only timbre data of eight tone colors. The tone generator 35 can generate music signals, for example, for four parts at the same time. For each part, a timbre read out of the timbre data storage unit (Voice RAM)

34 is set according to the timbre allocation data so that each part will generate a music signal with the pitch and the duration of tone generation determined according to the timbre parameters supplied from the sequencer 33. The music 5 signals generated for four parts are supplied to a digital/analog converter (DAC) 36 at predetermined reproduction timing to generate an analog music signal. The music signal is then decoded at the voice data processing unit 14 and mixed with a receiver signal by means of a mixer 10 37.

The following describes the operation of the music piece reproducing unit shown in Fig. 3. The user carrying the portable telephone 1 as shown in Fig. 2 selects a desired piece of music from information related to music such as 15 music titles displayed on the display 18 in a music piece reproducing mode. Then, music data corresponding to the selected piece are read out of the system RAM 11 and sent to the music piece reproducing unit 15 through the bus 24. Of the timbre data of eight tone colors in the music data 20 fetched through the interface 30, index data attached to the timbre data are decoded at the index decoder 32 and supplied and written as index data AD2 to the timbre data storage unit (Voice RAM) 34. The timbre data to be written to the timbre data storage unit (Voice RAM) 34 can be selected from many 25 kinds of timbre data stored in the system RAM 11 before transfer.

Fig. 5 illustrates an example of a timbre data format for eight tone colors written in the timbre data storage unit

(Voice RAM) 34. As shown in Fig. 5, timbre data from timbre 1 to timbre 8 are each composed of a waveform parameter, an envelope parameter, a modulation parameter and an effect parameter. Each parameter is peculiar to each of tone 1 to 5 tone 8. The waveform parameter of each timbre data indicates a waveform of the music piece. For example, if the tone generator 35 is a PCM tone generator having a waveform table, the waveform parameter is to specify one of waveforms on the waveform table. If the tone generator 35 is an FM tone 10 generator, the waveform parameter is to specify the algorithm that defines specific FM operations. The envelope parameter includes an attack rate, a decay rate, a sustain level and a release rate. The modulation parameter includes the depth or 15 velocity of a vibrato or tremolo. The effect parameter includes a reverb, a chorus and a variation.

Tempo data (Tempo) and timbre allocation data in the music data fetched through the interface 30 are taken into the sequencer 33 by the index decoder 32 supplying the sequencer 33 with index data attached to the tempo data and 20 the timbre allocation data as index data AD1. The sequencer 33 reads out of the timbre data storage unit (Voice RAM) 34 the timbre parameters specified by the timbre allocation data fetched, and sets the same on the tone generator 35. Fig. 6 illustrates an example of the timbre allocation data 25 configuration. As shown in Fig. 6, tones allocated for part 1 to part 4 are indicated by timbre numbers. In other words, when the sequencer 33 supplies the timbre number specified for each part to the timbre data storage means 34, timbre

parameters corresponding to the timbre number are read out of the timbre data storage means 34, and set on the tone generator 35 as a tone for each part.

It should be noted that the timbre data for music data to be reproduced are transferred to and written into the timbre data storage unit (Voice RAM) 34. Therefore, even if the timbre data storage unit (Voice RAM) 34 has such a small storage capacity that it can store only timbre data of eight tone colors in this embodiment, all the timbre data necessary for reproduction of the music data can be stored in the timbre data storage unit (Voice RAM) 34. In other words, even if the timbre data storage unit (Voice RAM) 34 has a small storage capacity, a piece of music with high sound quality can be reproduced based on the timbre data of high quality with an increased data amount. Further, since desired timbre data are selected from the system RAM 11 and written into the timbre data storage unit (Voice RAM) 34, a piece of music with a variety of tones can be reproduced. It should be noted that the timbre allocation data and the tempo data can be edited by the user.

32 words of musical score data in the music data fetched through the interface 30 are written into the FIFO 31 by the index decoder 32 decoding the index data attached to the musical score data and supplying a write pulse (WP) to the FIFO 31. The 32-word musical score data are thus written into the FIFO 31. The 32 words are part of musical score data of a piece of music; they are considered to be the top block of the musical score data. The musical score data

written in the FIFO 31 are composed of note data and rest data. Fig. 4 illustrates an example of such a data format. Fig. 4 shows one word of note data that includes information on an octave code, a note code, a part number to which the note data belong, an interval indicative of a time length to the next note or rest, and the duration of tone generation. Fig. 4 also shows one word of rest data that includes rest data indicative of the kind of rest, a part number to which the rest data belong, and an interval indicative of a time length to the next note or rest.

When the tone generator 35 reproduces a piece of music, the note data and the rest data are read sequentially from the FIFO 31, and therefore, there occurs a certain amount of vacant area in the FIFO 31 as these data are read out one by one. The FIFO 31 has only the top 32-word musical score data, but the next part of the musical score data can be written into the vacant area. Therefore, even if the musical score data requires a large amount of data memory area for reproduction of music of high quality, parts or sections of the score data can be written sequentially into the FIFO 31 as soon as there occurs a certain amount of available space in the FIFO 31, thus reproducing musical score data of high quality. The music piece reproducing apparatus of the present invention carries out reproduction of music data on such a principle of setting next words when available area in the FIFO 31 occurs at the timing of writing the next part of the musical score data. The IRQ point data is set to give the system CPU 10 an interrupt request signal (IRQ) that

instructs the system CPU 10 to write the subsequent part of musical score data into the FIFO 31. The IRQ point data is set prior to the start of reproduction. If the IRQ point data is set near 0 word, interrupt frequencies increase but 5 the number of words to be written at a time is reduced, resulting in a decrease in load on the system CPU 10. If the IRQ point data is set near 32 words, interrupt frequencies are reduced but the number of words to be written at a time increases, resulting in an increase in load on the system CPU 10. Therefore, it is preferable to set the IRQ point data 10 according to the processing speed of the system CPU 10.

Then, when the system CPU 10 instructs the music piece reproducing unit 15 to start reproduction of music data, the sequencer 33 applies a read pulse to the FIFO 31 to read the 15 musical score data sequentially from the FIFO 31. If the current musical data are note data, the sequencer 33 sets on the tone generator 35 pitch data of an octave code and a note code in the musical score data, part specifying information, and data specifying 'key-on' at timing based on the set tempo 20 and interval information. The tone generator 35 generates a musical sound with a pitch specified based on the timbre parameters set for the part specified from the data set in the tone generator register. Then, when time corresponding to the duration of tone generation for the note data has been 25 elapsed, the sequencer 33 sets on the tone generator 35 key-off data with specifying the corresponding part of the music piece. Then, the tone generator 35 silences the musical sound. Such a sequence of operations are repeated each time

the musical score data are read out of the FIFO 31, so that the music signals reproduced from the tone generator 35 are outputted to the DAC 36.

As the piece of music is reproducing, the interrupt 5 request signal (IRQ) is given to the system CPU 10 each time an available area detected in the FIFO 31 becomes equal to the IRQ point data value. Upon receipt of the IRQ, the system CPU 10 reads the next musical score data for a predetermined number of words (31-IRQ point) from the system 10 RAM 11, and sends the same to the bus 24. The musical score data are written into the available area in the FIFO 31 through the interface 30. Such write operation as to write the next musical score data for the predetermined number of words (31-IRQ point) into the FIFO 31 is repeatedly executed. 15 Therefore, even if the musical score data contain many words of data, all the data words can be written in the FIFO 31 after all. The musical score data read out of the FIFO 31 are then reproduced and outputted from the tone generator 35 according to the tempo data. Thus, according to the present 20 invention, a large amount of music data can be treated that allow the music piece to be reproduced with high quality even in a case where the FIFO 31 has such a small storage capacity, for example, only 32 words of music data.

Suppose that the music piece reproducing unit 15 is set 25 to reproduce a piece of music when a call arrives at the portable telephone 1. When a call arrives at the portable telephone 1, the above-mentioned music piece reproduction processing is so executed that a music signal outputted from

the DAC 36 will be issued from the speaker 23 as a calling tone. Suppose further that the music piece reproducing unit 15 is set to reproduce a piece of music as a holding tone when the user carrying the portable telephone 1 places a 5 conversation on hold. When the portable telephone 1 is changed to a holding mode, the above-mentioned music piece reproduction processing is so executed that a music signal outputted from the DAC 36 will be issued from the speaker 22 as a holding tone. Simultaneously, the music signal 10 outputted from the tone generator 35 are also supplied to the voice data processing unit 14 and sent through the communication unit 13 for the purpose of transmitting the holding tone.

Fig. 7 illustrates the detailed arrangement of the FIFO 15 31. Referring also to Fig. 8, the following describes the operation of the FIFO 31. When the IRQ point data is outputted from the interface 30, a latch pulse (LP) is supplied from the index decoder 32 to a latch circuit 43, and as a result, the IRQ point data, for example, set to "15" in 20 the latch circuit 43 is latched. Then, when the musical score data are outputted from the interface 30, the index decoder 32 applies a write pulse (WP) to a write address counter 41 and the up terminal of an up/down counter 45. The write pulse (WP) is generated each time one word of the 25 musical score data is outputted. In its initial state, the write pulses make progress in the write address counter 41 sequentially from "0" to "31," so that the top 32 words of musical score data are stored in a RAM 40 that has a storage

the DAC 36 will be issued from the speaker 23 as a calling tone. Suppose further that the music piece reproducing unit 15 is set to reproduce a piece of music as a holding tone when the user carrying the portable telephone 1 places a 5 conversation on hold. When the portable telephone 1 is changed to a holding mode, the above-mentioned music piece reproduction processing is so executed that a music signal outputted from the DAC 36 will be issued from the speaker 22 as a holding tone. Simultaneously, the music signal 10 outputted from the tone generator 35 are also supplied to the voice data processing unit 14 and sent through the communication unit 13 for the purpose of transmitting the holding tone.

Fig. 7 illustrates the detailed arrangement of the FIFO 31. Referring also to Fig. 8, the following describes the 15 operation of the FIFO 31. When the IRQ point data is outputted from the interface 30, a latch pulse (LP) is supplied from the index decoder 32 to a latch circuit 43, and as a result, the IRQ point data, for example, set to "15" in 20 the latch circuit 43 is latched. Then, when the musical score data are outputted from the interface 30, the index decoder 32 applies a write pulse (WP) to a write address counter 41 and the up terminal of an up/down counter 45. The write pulse (WP) is generated each time one word of the 25 musical score data is outputted. In its initial state, the write pulses make progress in the write address counter 41 sequentially from "0" to "31," so that the top 32 words of musical score data are stored in a RAM 40 that has a storage

capacity of at least 32 words. Simultaneously, the up/down counter 45 counts up from "0" to "31." Fig. 8(a) shows this state as the start of the first execution. Finally, the RAM 40 reaches the "FULL" state in which the write address W 5 comes to the address "31" and the read address R remains in the address "0."

Under this circumstance, when the start of reproduction of the music data is instructed, the sequencer 33 starts making progress while applying a read pulse (Read) to the 10 read address counter 42 so as to start reading the musical score data sequentially from the top one located at the address "0" on the RAM 40. The read pulse (Read) is also applied to the down terminal of the up/down counter 45. Thus, the up/down counter 45 counts up each time the write pulse 15 (WP) is applied, and counts down each time the read pulse (Read) is applied.

Fig. 8(b) shows a state of the RAM in which 16 words of the musical score data have been read out and reproduced. Since 16 words of the musical score data have been read out, 20 it is apparent that the read address counter 42 is at the address "15" and the counter value of the up/down counter 45 is $(31-16)=15$. As mentioned above, the IRQ point data latched in the latch circuit 43 is "15," and as a result, a comparison circuit 44 detects that the counter value of the 25 up/down counter 45 and the IRQ point data value of the latch circuit 43 match with each other. Then, the comparison circuit 44 outputs an interrupt request signal (IRQ) to the system CPU 10. Upon receipt of the IRQ, the system CPU 10

reads the next 16 words (31-IRQ point) of the musical score data from the system RAM 11, and sends the same to the bus 24.

The musical score data sent to the bus 24 are written from the addresses "0" to "15" that are now available on the RAM 40. In this case, the index decoder 32 applies the write pulse (WP) to the write address counter 41 and the up terminal of the up/down counter 45. 16 write pulses (WP) are generated for 16 words, and because of these pulses, the write address counter 41 that is set to count up to a modulus of 31 makes progress and reaches the address "15" while writing the musical score data to each corresponding address. Simultaneously, the up/down counter 45 is incremented by "16." However, since the up/down counter 45 counts down even in this case due to the read pulses (Read), the count value becomes the balance of the write pulses (WP) and the read pulses (Read). Fig. 8(c) shows a state of the RAM in which 16 words of the musical score data have been replenished as seen at the time of additional writing of 16 words.

Next, the sequencer 33 applies the read pulses (Read) to the read address counter 42, and as a result, 32 words of the musical score data are read out of the RAM 40. Such a state of the RAM 40 is shown in Fig. 8(d). Since the read address counter also counts up to the modulus of 31, the read address counter 42 is returned to the address "0" here. At this time, since the counter value of the up/down counter 45 is at the address "15" again, the comparison circuit 44 outputs the interrupt request signal (IRQ) again to the system CPU 10.

Then, the above-mentioned operations are so repeated that the subsequent 16 words of the musical score data are written into the addresses "16" to "31" on the RAM 40. Thus, the next 16 words of the musical score data are replenished until 5 the next 32 words of the musical score data are additionally written in total. Such a state of the RAM 40 is shown in Fig. 8(e).

As discussed above, 16 words of musical score data are additionally written and replenished to the RAM 40 10 sequentially each time there occurs 16 words of available area on the RAM 40. Therefore, even if the RAM 40 has a small storage capacity of at least 32 words, any music data having a large amount of musical score data that allow the music data to be reproduced with high quality can be written 15 sequentially onto the RAM 40 while reproducing the same. It should be noted that the counter value of the up/down counter 45 always matches the number of words of the musical score data that remain stored without being read out of the RAM 40.

When reproduced, each part has a timbre allocated 20 according to the timbre allocation data, or the timbre allocation data for each part may be inserted in the musical score data beforehand. During reproduction, the timbre allocation data are read out of the FIFO 31, so the sequencer 33 supplies the timbre data storage unit (Voice RAM) 34 with 25 a timbre number specified by the timbre allocation data. In this case, the timbre data of eight tone colors that are more than the number of parts, so any timbre can be selected for each part out of eight tone colors of the timbre data.

Timbre parameters corresponding to the timbre number are read out of the timbre data storage unit (Voice RAM) 34, and set in a tone generator register of the tone generator 35 for the part specified by the timbre allocation data. The timbre of 5 the part concerned to be reproduced on the tone generator 35 is thus changed during the reproduction.

As discussed above, since the timbre allocation data for each part is inserted in the musical score data, the timbre of each part can be voluntarily changed during the 10 reproduction. Further, the timbre data of eight tone colors stored in the timbre data storage unit (Voice RAM) 34 may be selected by the user out of all the timbre data stored in the system RAM 11, so that the selected timbre data can be transferred to the timbre data storage unit (Voice PAM) 34. 15 Since the system RAM 11 has many kinds of timbre data downloaded from the download center 6 or the external equipment 20, any timbre data from among the timbre data of many kinds can be selectively stored into the timbre data storage unit (Voice RAM) 34.

20 Fig. 9 is a flowchart illustrating music piece reproduction support processing executed by the system CPU 10 during the reproduction of a piece of music. When the portable telephone 1 is changed to the music piece reproducing mode, a music piece reproducing menu appears on the display 25 18. In step S1, the user selects a desired piece of music from the music selection menu by operating the dial buttons and the like. In this case, the selection is made from music data stored in the system RAM 11 and the system ROM 12. The

system RAM 11 stores music data downloaded from the download center 6 and the external equipment 20. After the completion of the selection, timbre data and tempo data are set in step S2. In step S2, timbre data of eight tone colors for 5 respective parts of the selected music data are transferred to the music piece reproducing 15 and stored in the timbre data storage unit (Voice RAM) 34. The tempo data for respective parts of the selected music data are also transferred to the music piece reproducing unit 15 and set in 10 the sequencer 33. The tempo data may be edited on the display 18 by operating the dial buttons and the like.

In step S3, the IRQ point data is set on the display 18 to a predetermined value by operating the dial buttons and the like. The IRQ data is set by taking into account the 15 processing speed of the system CPU 10. Then, 32 words of musical score data in the selected music data are read out of the system RAM 11, transferred to the music piece reproducing unit 15, and written into the FIFO 31 until the FIFO 31 becomes the "FULL" state.

20 In the next step S5, the system waits until start operation is instructed. The start operation is activated at the time of arrival of a call if the music data is to be reproduced as a calling tone, or by operating the holding button if it is to be reproduced as a holding tone. If it is 25 determined in step S5 that the start operation is instructed, the operating procedure goes to step S6 in which a start command is forwarded to the music piece reproducing unit 15.

If not determined that the start operation is instructed,

it branches to step S11 in which it is determined whether a button to instruct the start of reproduction is operated. If it is determined that the button is operated, the operating procedure returns to step S1 so that the operations from step 5 S1 to step S4 are repeated. If not determined that the button is operated, it returns to step S5 and waits until the start operation is instructed.

Upon receipt of the start command, the music piece reproducing unit 15 starts the above-mentioned music piece reproduction processing to reproduce the selected music piece. Then, when it is determined in step S7 that an interrupt request signal (IRQ) is generated to the music piece reproducing unit 15, the operating procedure goes to step S8 in which the musical score data for the next (31-IRQ point) 10 words are read out of the system RAM 11 and transferred to the music piece reproducing unit 15. The operations of steps S7 and S8 are repeated until it is determined in step S9 that stop operation is instructed. The stop operation is activated by operating a talk button if the music data has 15 been reproduced as the calling tone, or by operating a holding tone releasing button if it has been reproduced as the holding tone. If it is determined in step S9 that the stop operation is instructed, the operating procedure goes to step S10 in which a stop command is forwarded to the music 20 piece reproducing unit 15 to instruct the music piece reproducing unit 15 to stop the music piece reproduction processing. Then, the operating procedure returns to step S5 25 and waits until the start operation is instructed again.

As discussed above, the music piece reproduction processing to reproduce the selected music piece is executed at the time of arrival of a call if the selected music piece is to be reproduced as a calling tone, or by operating the holding button if it is to be reproduced as the holding tone. In either case, the music piece to be reproduced is the one that has been selected in the step of music selection. The music selection may be made to select different music pieces for the calling tone and the holding tone so that both music pieces can be reproduced independently when the start of either the calling tone or the holding tone is instructed. Further, since the music selection can be made at any time, any music piece can be selected for both the calling tone and the holding tone.

It should be noted that the system CPU 10 executes the main processing for telephony functions, not shown. However, the music piece reproduction support processing only requires such a light load that the system CPU 10 can execute the music piece reproduction support processing together with its main processing without the need of replacing the system CPU 10 by high-speed one.

Although in this embodiment the FIFO has such a storage capacity that it can store 32 words of musical score data, the present invention is not limited to this capacity. The storage capacity of the FIFO 31 can vary as long as it is much smaller than that of the system RAM 11. Further, the timbre data storage unit (Voice RAM) 34 has such a storage capacity that it can store timbre data of eight tone colors,

but it is not limited to the capacity as well. The capacity of the timbre data storage unit (Voice RAM) 34 can be extremely reduced, compared to that of the system RAM 11, as long as the number of tone colors is equal to or more than 5 the number of parts of the music piece corresponding to channels of tone generation.

As mentioned above, the tone generator 35 in the music piece reproducing unit 15 can be a frequency modulation type of tone generator, i.e., an FM tone generator. The FM tone 10 generator is designed to use out-of-phase harmonics produced by frequency modulation to synthesize musical sounds; it can generate waveforms having out-of-phase harmonic components like inharmonic tones in a relatively simple circuit configuration. The FM tone generator has the advantage of 15 generating a wide range of musical sounds from a synthesized tone to an electronic tone. Fig. 10 illustrates an example of such a configuration.

The FM tone generator uses oscillators called operators that oscillate equivalently to generate a sine wave. As 20 shown in Fig. 10, the FM tone generator 50 is made of the operator 1 and the operator 2 connected in series. A sine wave oscillated from the operator 1 is supplied to the operator 2 as a modulation signal so that the operator 2 generates a frequency modulated wave $FM(t)$. On one hand, the 25 operator 1 is called a modulator 51 because it generates a modulation signal; on the other hand, the operator 2 is called a carrier 52 because it generates a carrier wave. The operators 1 and 2 are configured in the same manner.

In the modulator 51, a pitch generator 51c outputs pitch data variable in the form of a sawtooth according to the input of phase angle data ω_m . Then, the pitch data and modulation data "0" inputted to the modulator 51 are added at 5 an adder 51a. The output of the adder 51a is supplied to a sine wave generator 51b in which a sine wave table is read according to the pitch data outputted from the adder 51a as the data that varies in the form of a sawtooth. Then, the sine wave generator 51b generates a sine wave at frequencies 10 corresponding to varied velocities of the pitch data. The amplitude of the sine wave is controlled by amplitude data B generated from an envelope generator 51d. For this reason, the sine wave outputted from the sine wave generator 51b is represented by $B \cdot \sin \omega_m t$.

15 In the carrier 52, a pitch generator 52c outputs pitch data variable in the form of a sawtooth according to the input of phase angle data ω_c . Then, the pitch data and the sine wave of modulation signal outputted from the modulator 51 are added at an adder 52a. The output of the adder 52a is 20 supplied to a sine wave generator 52b in which a sine wave table is read according to the added data outputted from the adder 52a. Then, the sine wave generator 52b generates a sine wave varied according to the rate of change in the added data. The amplitude of the sine wave is controlled by 25 amplitude data A generated from an envelope generator 52d. For this reason, the sine wave outputted from the sine wave generator 52b is represented by $A \cdot \sin (\omega_c t + B \sin \omega_m t)$. Thus,

the output $FM(t)$ from the carrier 52 is subjected to frequency modulation, and the above equations are basic formulas for the FM tone generator 50.

As shown in Fig. 10, since the modulator 51 and the carrier 52 have the same circuit configuration, the frequency modulated wave can be generated in such a configuration that either of them feeds back its output as its input. This type of FM tone generator is called a feedback FM tone generator, and an example of such a configuration is shown in Fig. 11.

As shown in Fig. 11, the feedback FM tone generator 60 is constituted of an operator 61 and a feedback circuit 62. In the operator 61, a pitch generator 61c outputs pitch data variable in the form of a sawtooth according to the input of phase angle data ω_m . Then, the pitch data and modulation data "0" inputted to the operator 61 are added at an adder 61a. The output of the adder 61a is supplied to a sine wave generator 61b in which a sine wave table is read according to the added data outputted from the adder 61a. Then, the sine wave generator 61b generates a sine wave varied according to the rate of change in the added data. The amplitude of the sine wave is controlled by amplitude data B generated from an envelope generator 61d. The output of the sine wave generator 61b is so controlled that a feedback rate β can be obtained in a feedback circuit 62. Then, it is inputted to the adder 61a as a modulation signal. The sine wave generator 61b thus outputs an output $FM(t)$ that is subjected to frequency modulation.

The feedback FM tone generator 60 is suitable for generation of a string type of music sound. The FM tone generators 50 and 60 can generate musical sounds of different tones by changing the way or method to connect the circuits on an operator basis. The method of connecting operators is called the algorithm.

In the above-described FM tone generators, the tone can vary by controlling the pitch data varied in the form of a sawtooth and outputted from the pitch generator, by controlling the amplitude outputted from the envelope generator, or by changing the algorithm. Timbre data for obtaining desired tone colors on the FM tone generators consist of timbre data for the modulator and timbre data for the carrier. The amount of data for one tone color can be extremely reduced compared to that of the waveform memory type of tone generator.

Fig. 12 illustrates an example of a timbre data format for eight tone colors written in the timbre data storage unit (Voice RAM) 34 when the tone generator 35 assumes the form of an FM tone generator. Timbre data of eight tone colors, such as timbre 1, timbre 2, ... written in the timbre data storage unit (Voice RAM) 34 each contain timbre data for the modulator and timbre data for the carrier. Both timbre data for the modulator and the carrier assume the same data format. An example of such a data format is shown in Fig. 13. As shown in Fig. 13, each timbre data for the modulator or the carrier may be 32 bits of data containing the following: three bits of multiple setting data (ML2-ML0), a bit of

vibrato ON/OFF data (VIB), a bit of envelope waveform type data (EGT), a bit of sustain ON/OFF data (SUS), four bits of attack rate setting data (AR3-AR0), four bits of decay rate setting data (DR3-DR0), four bits of sustain level setting data (SL3-SL0), four bits of release rate setting data (RR3-RR0), a bit of waveform selecting data (WAV), three bits of feedback amount setting data (FL2-FL0), and six bits of total level data (TL5-TL0).

The multiple setting data (ML2-ML0) are adopted to set an oscillator frequency magnification. The pitch generator generates pitch data with a rate of change multiplied by the magnification specified by the multiple setting data. The magnification set by the multiple setting data may range from ± 0.5 to ± 7 , and if the multiple setting data is used in the modulator 51, the frequency of the modulation signal is changed to vary the timbre. The vibrato ON/OFF data (VIB) are set to determine whether a vibrato is applied or not. The envelope waveform type data (EGT) are set to determine whether the envelope waveform is of an envelope of sustained sound or an envelope of decayed sound. The sustain ON/OFF data (SUS) are data by which the release rate is changed to another release rate tilted at a predetermined gentle angle at timing of terminating the length of tone generation if the sustain ON/OFF data is set ON, or the release rate becomes a set value at timing of terminating the length of tone generation if the sustain ON/OFF data is set OFF.

The attack rate setting data (AR3-AR0) are used to set

the time from when tone generation commences until it reaches the maximum volume. The time set by the attack rate setting data may range from 0.0 ms to 38.1 sec. The decay rate setting data (DR3-DR0) are used to set the decay time from 5 when the sound reaches the maximum volume until it falls into the sustain level. The decay time set by the decay rate setting data may range from 4.47 ms to 73.2 sec. The sustain level setting data (SL3-SL0) are used to set a sustain level when the envelope waveform is determined by the envelope 10 waveform type data (EGT) to be sustain sound.

In the case of decayed sound, the release rate setting data (RR3-RR0) sets the decay time from the sustain level to the timing at which the length of the tone generation is terminated, and after the timing of terminating the duration 15 of the tone generation, it is decayed at a predetermined sharp angle of tilt. In the case of sustained sound, the release rate setting data sets the decay rate from the timing of terminating the tone generation. The decay rate set by the release rate setting data may range from 4.47 ms to 73.2 20 sec.

The waveform selection data (WAV) are set to determine whether the waveform generated by the sine wave generator is a sine wave or a half-wave rectified sine wave. The feedback amount setting data (FL2-FL0) are used to set a feedback 25 factor for the feedback FM tone generator shown in Fig. 11; they are effective for the carrier operator alone. Therefore, it is desirable to set the data in the carrier so as to generate a string type of tone. The feedback amount setting

data may be represented as time ranging from 0 to 4π . The total level data (TL5-TL0) are designed to set the total volume.

If the tone generator 35 is thus configured as an FM tone generator, for example, timbre data of one tone color can be represented as a pair of 32-bit (32 x 2 bits) data consisting of 32-bit timbre data for the modulator and 32-bit timbre data for carrier. Since the amount of timbre data for eight tone colors to be stored in the timbre data storage unit (Voice RAM) 34 can be reduced to 8 x (32 x 2) bits, i.e., 64 bytes, the use of the FM tone generator as the tone generator 35 has the advantage of reducing the storage capacity of the timbre data storage unit (Voice RAM) 34. Further, even if the transfer rate of timbre data to the timbre data storage unit (Voice RAM) 34 is low, since the amount of timbre data for eight tone colors is reduced, the timbre data can be transferred in a very short time. Therefore, even if the processing speed of the CPU 10 is slow, a music piece of several tones can be reproduced with high quality. Furthermore, timbre data can be downloaded from the download center 6 in a short time because of a small amount of timbre data per tone color. The amount of timbre data per tone color may be a few k-bytes for the waveform memory type of tone generator (PCM tone generator). Therefore, it is apparent that the use of an FM tone generator allows the amount of timbre data per tone color to be greatly reduced compared to that for the waveform memory type of tone

generator.

Although the use of an FM tone generator is described here, the present invention is not limited thereto, and other types of tone generator, such as tone generators of the waveform memory type (PCM tone generator) and of physical model type, can be used as the tone generator 35 in the music piece reproducing apparatus of the present invention. 5 Furthermore, the tone generator may also be composed of either hardware using a DSP or the like or software implementing a tone generator program. Furthermore, the musical score data 10 are formatted as shown in Fig. 4, but the present invention is not limited to this format. For example, the musical score data may be transferred as a MIDI file with time 15 information or an SMF (standard MIDI file).

As described above, according to one aspect of the present invention, timbre data transferred through the interface means are stored into the timbre data storage means, the storage capacity of which is available only for necessary kinds of timbre data, so that the data amount for parameters 20 in the timbre data can be large enough to obtain tones of high quality even if the timbre data storage means has a small storage capacity, thereby reproducing a piece of music with tones of high quality.

Further, among the many kinds of timbre data stored in 25 the storage means provided outside the music piece reproducing means, only the timbre data necessary to reproduce a piece of music are transferred to the music piece reproducing means and stored in the timbre data storage means.

so that several kinds of timbre data can be selected with which the piece of music is reproduced even though the storage capacity of the timbre data storage means is small. In addition, if the timbre data are downloaded to an external 5 storage means through a communication line, a choice of timbre data can be widened.

All the data processing means has to do is to read desired timbre data and to send the same to the music piece reproducing means; it is not required to carry out 10 reproduction of a piece of music. This allows music of high quality to be reproduced even with a low-speed processing unit.

In addition, if the tone generator of the music piece reproducing means provided in a telephone terminal device is 15 adopting a frequency modulating method, the amount of timbre data required for the frequency modulation type of tone generator can be extremely reduced as compared to that of a waveform memory type of tone generator (PCM tone generator). Therefore, even if the timbre data is transmitted through a 20 low-speed transmission path, for example, due to low speed of data processing by the data processing unit, the telephone terminal device can reproduce a piece of music with a variety of tones of high quality. Further, since the amount of timbre data is reduced, timbre data enough to reproduce a 25 piece of music with tones of high quality can be stored even in a timbre data storage means, the storage capacity of which is small. Furthermore, timbre data can be downloaded from the download center in a short time because of a small amount

of timbre data per tone color.

According to another aspect of the present invention, when a vacant area is created in the musical score storing memory, a next portion of the musical score data is 5 subsequently loaded into the memory. By such a construction, a music piece of a high quality requiring a great data volume can be reproduced even though the music score storing memory has a small capacity. A music piece having a long play time can be reproduced without interruption.

10 Further, the CPU is not required to execute the music reproduction process, but simply executes a data transfer process of feeding a next portion of the music score data when a vacant area is yielded in the memory buffering the music score data. Therefore, the CPU of moderate speed may 15 be sufficient to reproduce the high quality of the melody tones.

1. A music reproducing apparatus for use in a telephony terminal apparatus having a telephony function of
5 transmitting a signal to a remote location and receiving a signal from the remote location, the music reproducing apparatus being used to reproduce a music piece in association with the telephony function, and comprising:

10 a timbre data memory that has a limited capacity for storing timbre data corresponding to a first number of timbres, which is less than a second number of timbres reserved in a data source of the telephony terminal apparatus;

15 an interface that can be operated to transfer the timbre data from the data source to the timbre data memory so that the timbre data memory stores the transferred timbre data;

20 a score data memory that stores score data representing a music piece;

25 a tone generator that is set with a tone generating parameter derived from the score data stored in the score data memory for generating tones of the music piece; and

30 a performance controller that interprets the score data to read out timbre data designated by the score data from the timbre data memory for setting the tone generator with the read timbre data so that the tone generator can generate the tones having timbres specified by the score data according to

the read timbre data.

2. The music reproducing apparatus according to claim 1,
wherein the tone generator can concurrently generate a third
5 number of tones allotted to respective parts of the music
piece, which are not more than the second number of timbres
available by the timbre data memory, and the performance
controller reads out timbre data corresponding to the third
member of timbres which are assigned to the respective parts
10 according to the score data.

3. A telephony terminal apparatus comprising:

a processor that processes data to execute a task with a
telephony function of transmitting a signal to a remote
15 location and receiving a signal from the remote location;

a memory device that memorizes data including music data
comprised of timbre data and score data to represent music
pieces; and

20 a music reproduction device that operates according to
the music data under control by the processor to reproduce a
music piece in association with the task executed by the
processor, wherein the music reproduction device comprises:

25 a timbre data memory that has a limited capacity for
storing timbre data corresponding to a first number of
timbres, which is less than a second number of timbres
reserved in the memory device;

an interface that can be operated to transfer the timbre data from the memory device to the timbre data memory so that the timbre data memory stores the transferred timbre data;

5 a score data memory that stores score data representing a music piece;

a tone generator that is set with a tone generating parameter derived from the score data stored in the score data memory for generating tones of the music piece; and

10 a performance controller that interprets the score data to read out timbre data designated by the score data from the timbre data memory for setting the tone generator with the read timbre data so that the tone generator can generate the tones having timbres specified by the score data according to the read timbre data.

15

4. The telephony terminal apparatus according to claim 3, wherein the tone generator can concurrently generate a third number of tones allotted to respective parts of the music piece, which are not more than the second number of timbres 20 available by the timbre data memory, and the performance controller reads out timbre data corresponding to the third member of timbres which are assigned to the respective parts according to the score data.

25 5. The telephony terminal apparatus according to claim 3, further comprising a communication device that can

communicate with an external database to download therefrom music data into the memory device.

6. A telephony terminal apparatus having a communication unit that transmits a signal to a remote location and receives a signal from the remote location, and a music reproduction unit that can reproduce a music piece in association with the signal, wherein

the music reproduction unit comprises:

10 a score data memory that memorizes score data representing a music piece;

a tone generator of a frequency modulation type settable with parameters for generating harmonics by frequency modulation to synthesize a tone; and

15 a performance controller that sets the tone generator with parameters according to the memorized score data for enabling the tone generator to synthesize tones of the music piece represented by the score data.

20 7. The telephony terminal apparatus according to claim 6, wherein the music reproduction unit further comprises a timbre data memory that has a limited capacity for memorizing timbre data corresponding to a predetermined number of timbres, and the performance controller interprets the score data to read out timbre data corresponding to a timbre 25 designated by the score data from the timbre data memory, and

sets the tone generator according to the read timbre data to thereby enable the tone generator to synthesize the tones of the music piece having the timbre designated by the score data.

5

8. The telephony terminal apparatus according to claim 7, wherein the music reproduction unit further comprises an interface that can transfer data including the timbre data between the music reproduction unit and other units, the 10 interface being operated for transferring the timbre data to the music reproduction unit so as to load the timbre data memory.

9. The telephony terminal apparatus according to claim 8, 15 further comprising a central processing unit that treats various data and a memory unit that reserves various data including music data composed of score data and timbre data, wherein the interface is operated under control by the central processing unit for transferring the timbre data from 20 the memory unit to the timbre data memory of the music reproduction unit and for transferring the score data from the memory unit to the score data memory of the music reproduction unit.

25 10. The telephony terminal apparatus according to claim 9, wherein the memory unit reserves timbre data corresponding to

a first number of timbres, wherein the timbre data memory of the music reproduction unit memorizes timbre data being transferred from the memory unit and corresponding to a second number of timbres which are less than the first number 5 of timbres, wherein the tone generator can concurrently generate a third number of tones allotted to respective parts of the music piece, which are not more than the second number of timbres available by the timbre data memory, and wherein the performance controller reads out timbre data from the 10 timbre data memory corresponding to the third member of timbres which are assigned to the respective parts according to the score data.

11. The telephony terminal apparatus according to claim 9, 15 wherein the communication unit can receive a signal representing either of the score data and the timbre data so as to download the same into the memory unit.

12. A music reproducing apparatus for use in a telephony 20 terminal apparatus having a telephony function of transmitting a signal to a remote location and receiving a signal from the remote location. the music reproducing apparatus being used to reproduce a music piece in association with the telephony function, and comprising: 25 a score data memory that has a limited space for storing a part of score data, which represents a music piece and

which can be provided from a data source of the telephony terminal apparatus;

an interface that can be operated to load the score data from the data source into the score data memory;

5 a tone generator that is set with a variable parameter derived from the score data for sequentially generating tones of the music piece;

10 a performance controller that sequentially retrieves the score data from the score data memory so as to set the tone generator with the variable parameter according to the retrieved score data; and

15 a memory monitor that detects when a vacant area is created in the limited space of the score data memory upon sequential retrieval of the score data for operating the interface to load another part of the score data into the vacant area, thereby enabling the tone generator to continue the generating of the tones of the music piece.

13. The music reproducing apparatus according to claim 12,
20 further comprising a timbre data memory that stores timbre data corresponding to a number of timbres, wherein the performance controller reads out timbre data corresponding to a timbre designated by the score data from the timbre data memory, and sets the tone generator with the read timbre data, thereby enabling the tone generator to generate the tones of the music piece having the designated timbre.

14. A telephony terminal apparatus comprising:

a processor that processes data to execute a task with a telephony function of transmitting a signal to a remote

5 location and receiving a signal from the remote location;

a memory device that memorizes data including score data representative of a music piece; and

a music reproduction device that operates according to the score data under control by the processor to reproduce a 10 music piece in association with the task, wherein the music reproduction device comprises:

a score data memory that has a limited space for storing a part of score data, which represents a music piece and which can be provided from the memory device;

15 an interface that can be operated to load the score data from the memory device into the score data memory;

a tone generator that is set with a variable parameter derived from the score data for sequentially generating tones of the music piece;

20 a performance controller that sequentially retrieves the score data from the score data memory so as to set the tone generator with the variable parameter according to the retrieved score data; and

25 a memory monitor that notifies the processor when a vacant area is created in the limited space of the score data memory upon sequential retrieval of the score data, so that

the processor operates the interface to load another part of the score data from the memory device into the vacant area of the limited space of the score data memory, thereby enabling the tone generator to continue the generating of the tones of
5 the music piece.

15. The telephony terminal apparatus according to claim 14, further comprising a timbre data memory that stores timbre data corresponding to a number of timbres, wherein the
10 performance controller reads out timbre data corresponding to a timbre designated by the score data from the timbre data memory, and sets the tone generator with the read timbre data, thereby enabling the tone generator to generate the tones of the music piece having the designated timbre.

15

16. The telephony terminal apparatus according to claim 14, further comprising a communication device that can communicate with an external database to download therefrom score data into the memory device.

20

17. A method of reproducing a music piece in a telephony terminal apparatus having a telephony function of transmitting a signal to a remote location and receiving a signal from the remote location, comprising the steps of:
25 providing a timbre data memory that has a limited capacity capable of storing timbre data corresponding to a

first number of timbres, which is less than a second number of timbres reserved in a data source of the telephony terminal apparatus;

5 operating an interface to transfer the timbre data from the data source to the timbre data memory so that the timbre data memory stores the transferred timbre data;

15 storing score data representing a music piece in a score data memory;

10 setting a tone generator with a tone generating parameter derived from the score data stored in the score data memory for generating tones of the music piece in association with the telephony function; and

15 interpreting the score data to read out timbre data designated by the score data from the timbre data memory for setting the tone generator with the read timbre data so that the tone generator can generate the tones having timbres specified by the score data according to the read timbre data.

18. A method of reproducing a music piece from a telephony terminal apparatus having a processor that processes data to execute a task with a telephony function of transmitting a signal to a remote location and receiving a signal from the remote location, a memory device that memorizes data including music data comprised of timbre data and score data to represent music pieces, and a music reproduction device that operates according to the music data under control by

the processor to reproduce a music piece in association with the task executed by the processor, the method comprising the steps of:

providing the music reproduction device with a timbre data memory that has a limited capacity capable of storing timbre data corresponding to a first number of timbres, which is less than a second number of timbres reserved in the memory device;

operating an interface to transfer the timbre data from the memory device to the timbre data memory so that the timbre data memory stores the transferred timbre data;

storing score data representing a music piece in a score data memory of the music production device;

setting a tone generator of the music reproduction device with a tone generating parameter derived from the score data stored in the score data memory for generating tones of the music piece; and

interpreting the score data to read out timbre data designated by the score data from the timbre data memory for setting the tone generator with the read timbre data so that the tone generator can generate the tones having timbres specified by the score data according to the read timbre data.

19. A method of reproducing a music piece by a telephony terminal apparatus having a communication unit that transmits a signal to a remote location and receives a signal from the

remote location, and a music reproduction unit that can reproduce a music piece in association with the signal, the method comprising the steps of:

providing the music reproduction unit with a score data 5 memory that memorizes score data representing a music piece;

providing the music reproduction unit with a tone generator of a frequency modulation type settable with parameters for generating harmonics by frequency modulation to synthesize a tone; and

10 setting the tone generator with parameters according to the memorized score data for enabling the tone generator to synthesize tones of the music piece represented by the score data.

15 20. A method of reproducing a music piece in a telephony terminal apparatus having a telephony function of transmitting a signal to a remote location and receiving a signal from the remote location, comprising the steps of:

providing a score data memory that has a limited space 20 capable of storing a part of score data, which represents a music piece and which can be provided from a data source of the telephony terminal apparatus;

operating an interface to load the score data from the data source into the score data memory;

25 setting a tone generator with a variable parameter derived from the score data for sequentially generating tones

of the music piece in association with the telephony function;

5 sequentially retrieving the score data from the score data memory so as to set the tone generator with the variable parameter according to the retrieved score data; and

detecting when a vacant area is created in the limited space of the score data memory upon sequential retrieval of the score data for operating the interface to load another part of the score data into the vacant area, thereby enabling 10 the tone generator to continue the generating of the tones of the music piece.

21. A method of reproducing a music piece from a telephony terminal apparatus having a processor that process a data to 15 execute a task with a telephony function of transmitting a signal to a remote location and receiving a signal from the remote location, a memory device that memorizes data including score data representative of a music piece and a music reproduction device that operates according to the 20 score data under control by the processor to reproduce a music piece in association with the task, the method comprising the steps of:

25 providing the music reproduction device with a score data memory that has a limited space capable of storing a part of score data, which represents a music piece and which can be provided from the memory device;

operating an interface to load the score data from the memory device into the score data memory;

setting a tone generator of the music reproduction device with a variable parameter derived from the score data
5 for sequentially generating tones of the music piece;

sequentially retrieving the score data from the score data memory so as to set the tone generator with the variable parameter according to the retrieved score data; and

notifying the processor when a vacant area is created in
10 the limited space of the score data memory upon sequential retrieval of the score data, so that the processor operates the interface to load another part of the score data from the memory device into the vacant area of the limited space of the score data memory, thereby enabling the tone generator to
15 continue the generating of the tones of the music piece.

22. A machine readable medium for use in a music reproducing apparatus having a processor inside a telephony terminal apparatus having a telephony function of transmitting a
20 signal to a remote location and receiving a signal from the remote location. the music reproducing apparatus being used to reproduce a music piece in association with the telephony function. the medium containing program instructions executable by the processor for causing the music reproducing apparatus to perform a method comprising the steps of:

preparing a timbre data memory that has a limited

capacity capable of storing timbre data corresponding to a first number of timbres, which is less than a second number of timbres reserved in a data source of the telephony terminal apparatus;

5 operating an interface to transfer the timbre data from the data source to the timbre data memory so that the timbre data memory stores the transferred timbre data;

storing score data representing a music piece in a score data memory;

10 setting a tone generator with a tone generating parameter derived from the score data stored in the score data memory for generating tones of the music piece; and

interpreting the score data to read out timbre data designated by the score data from the timbre data memory for 15 setting the tone generator with the read timbre data so that the tone generator can generate the tones having timbres specified by the score data according to the read timbre data.

23. A machine readable medium for use in a telephony

20 terminal apparatus having a processor that processes data to execute a task with a telephony function of transmitting a signal to a remote location and receiving a signal from the remote location, a memory device that memorizes data including music data comprised of timbre data and score data 25 to represent music pieces, and a music reproduction device that operates according to the music data under control by

the processor to reproduce a music piece in association with the task executed by the processor, the medium containing program instructions executable by the processor for causing the telephony terminal apparatus to carry out a method

5 comprising the steps of:

allotting the music reproduction device with a timbre data memory that has a limited capacity capable of storing timbre data corresponding to a first number of timbres, which is less than a second number of timbres reserved in the

10 memory device;

operating an interface to transfer the timbre data from the memory device to the timbre data memory so that the timbre data memory stores the transferred timbre data;

15 loading score data representing a music piece in a score data memory of the music reproduction device;

setting a tone generator of the music reproduction device with a tone generating parameter derived from the score data loaded in the score data memory for generating tones of the music piece; and

20 interpreting the score data to read out timbre data designated by the score data from the timbre data memory for setting the tone generator with the read timbre data so that the tone generator can generate the tones having timbres specified by the score data according to the read timbre data.

25

24. A machine readable medium for use in a telephony

terminal apparatus having a central processing unit, a communication unit that transmits a signal to a remote location and receives a signal from the remote location, and a music reproduction unit that can reproduce a music piece in association with the signal, the medium containing program instructions executable by the central processing unit for causing the telephony terminal apparatus to perform a method comprising the steps of:

10 allotting the music reproduction unit with a score data memory that memorizes score data representing a music piece;

providing the music reproduction unit with a tone generator of a frequency modulation type settable with parameters for generating harmonics by frequency modulation to synthesize a tone; and

15 setting the tone generator with parameters according to the memorized score data for enabling the tone generator to synthesize tones of the music piece represented by the score data.

20 25. A machine readable medium for use in a music reproducing apparatus having a processor inside a telephony terminal apparatus having a telephony function of transmitting a signal to a remote location and receiving a signal from the remote location. the music reproducing apparatus being used to reproduce a music piece in association with the telephony function. the medium containing program instructions

executable by the processor for causing the music reproducing apparatus to perform a method comprising the steps of:

5 providing a score data memory that has a limited space capable of storing a part of score data, which represents a music piece and which can be provided from a data source of the telephony terminal apparatus;

operating an interface to load the score data from the data source into the score data memory;

10 setting a tone generator with a variable parameter derived from the score data for sequentially generating tones of the music piece;

sequentially retrieving the score data from the score data memory so as to set the tone generator with the variable parameter according to the retrieved score data; and

15 detecting when a vacant area is created in the limited space of the score data memory upon sequential retrieval of the score data for operating the interface to load another part of the score data into the vacant area, thereby enabling the tone generator to continue the generating of the tones of
20 the music piece.

26. A machine readable medium for use in a telephony terminal apparatus having a processor that processes data to execute a task with a telephony function of transmitting a signal to a remote location and receiving a signal from the remote location, a memory device that memorizes data

including score data representative of a music piece and a music reproduction device that operates according to the score data under control by the processor to reproduce a music piece in association with the task, the medium 5 containing program instructions executable by the processor for causing the telephony terminal apparatus to perform a method comprising the steps of:

allotting the music reproduction device with a score data memory that has a limited space capable of storing a 10 part of score data, which represents a music piece and which can be provided from the memory device;

operating an interface to load the score data from the memory device into the score data memory;

15 setting a tone generator of the music reproduction device with a variable parameter derived from the score data for sequentially generating tones of the music piece;

sequentially retrieving the score data from the score data memory so as to set the tone generator with the variable parameter according to the retrieved score data; and

20 notifying the processor when a vacant area is created in the limited space of the score data memory upon sequential retrieval of the score data, so that the processor operates the interface to load another part of the score data from the memory device into the vacant area of the limited space of 25 the score data memory, thereby enabling the tone generator to continue the generating of the tones of the music piece.

(54) Title: MUSIC REPRODUCING APPARATUS, MUSIC REPRODUCING METHOD AND TELEPHONE TERMINAL DEVICE

WO 01/11603 A1

(57) Abstract: In a music reproducing apparatus, a timbre data memory has a limited capacity for storing timbre data corresponding to a first number of timbres, which is less than a second number of timbres reserved in a data source. An interface can be operated to transfer the timbre data from the data source to the timbre data memory so that the timbre data memory stores the transferred timbre data. A score data memory stores score data representing a music piece. A tone generator is set with a tone generating parameter derived from the score data stored in the score data memory for generating tones of the music piece. A performance controller interprets the score data to read out timbre data designated by the score data from the timbre data memory for setting the tone generator with the read timbre data so that the tone generator can generate the tones having timbres specified by the score data. Further, a memory monitor detects when a vacant area is created in a limited space of the score data memory upon sequential retrieval of the score data for operating the interface to load another part of the score data into the vacant area, thereby enabling the tone generator to continue the generating of the tones of the music piece.

PATENT
Docket No.

DECLARATION FOR UTILITY PATENT APPLICATION

AS A BELOW-NAMED INVENTOR, I HEREBY DECLARE THAT:

My residence, post office address, and citizenship are as stated below next to my name.

I believe I am the original, first and sole inventor, if only one name is listed below, or a joint inventor if plural inventors are named below, of the subject matter which is claimed and for which a patent is sought on the invention entitled:
MUSIC REPRODUCING APPARATUS, MUSIC REPRODUCING METHOD AND TELEPHONE TERMINAL DEVICE

the specification of which is attached hereto unless the following box is checked:

was filed on August 3, 2000 as United States Application Serial No. _____ or PCT International Application No. PCT/JP00/05199 and was amended on October 12, 2001 (if applicable).

I HEREBY STATE THAT I HAVE REVIEWED AND UNDERSTAND THE CONTENTS OF THE ABOVE-IDENTIFIED SPECIFICATION, INCLUDING THE CLAIMS, AS AMENDED BY ANY AMENDMENT REFERRED TO ABOVE.

I acknowledge the duty to disclose information which is material to the patentability as defined in 37 C.F.R. § 1.56.

I hereby claim foreign priority benefits under 35 U.S.C. § 119(a)-(d) or § 365(b) of any foreign application(s) for patent or inventor's certificate, or § 365(a) of any PCT International application which designated at least one country other than the United States listed below and have also identified below, by checking the box, any foreign application for patent or inventor's certificate, or PCT International application having a filing date before that of the application on which priority is claimed:

Application No.	Country	Date of Filing (day/month/year)	Priority claimed ?
11/222319	Japan	5/8/1999	Yes
11/222320	Japan	5/8/1999	Yes
11/309408	Japan	29/10/1999	Yes
PCT/JP00/05199	PCT	3/8/2000	Yes

I hereby claim benefit under 35 U.S.C. § 119(e) of any United States provisional application(s) listed below:

Application Serial No.	Filing Date

I hereby claim the benefit under 35 U.S.C. § 120 of any United States application(s), or § 365(c) of any PCT International application designating the United States, listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States or PCT International application in the manner provided by the first paragraph of 35 U.S.C. § 112, I acknowledge the duty to disclose information which is material to patentability as defined in 37 C.F.R. § 1.56 which became available between the filing date of the prior application and the national or PCT International filing date of this application.

Application Serial No.	Filing Date	Status
		<input type="checkbox"/> Patented <input type="checkbox"/> Pending <input type="checkbox"/> Abandoned

I hereby appoint the following attorneys and agents to prosecute this application and to transact all business in the Patent and Trademark Office connected therewith:
